ARTICLE DETAILS	ABSTRACT
History <i>Revised format: November 2019</i> <i>Available Online: December 2019</i>	Purpose: The purpose of this paper is to investigate the role of company industry, IPO timing, owners' reputation and marketing efforts in investor's decision in Syrian initial public offering market IPOs Design/Methodology/Approach: A questionnaire survey was administered to 270 investors in Damascus Securities Exchange. Some descriptive statistics and One-Sample tests were used to analyze the data and test the hypotheses. Findings: The research found that investor's decision is influenced significantly by IPO timing, owner's reputation and marketing efforts in the Syrian IPOs market. Implications/Originality/Value: This research presents that Syrian companies can use these factors as an approach to increase the quality of their IPO, on another hand, financial regulators can enhance the IPO control process, adding to the results that can contribute to understanding marketing-finance interface and behavioral finance literature.

1. Introduction

As an important part of the financial system, financial markets have become an important pillar of the modern economy. It provides good opportunities for individual investors as well as funding for private and government institutions. It also provides a convergence of borrowers with lenders and thus contributes to the efficiency of the economy through the efficient allocation of capital, which includes an economic function in the welfare of society. Conversely, market vibrations or poor regulation are leading to serious economic consequences. (Mishkin, 2004)

The capital market is a marketplace in which financial instruments are issued and traded (Jakob et al, 2009, p65). In other words, it is the framework in which the supply and demand sides of securities interact regardless of the spatial dimension (Gitman & Joehnk, 2008), and are mainly divided into primary markets where securities are sold for the first time, and the secondary market is concerned with post-issue transactions (DG EAC, 2010) Thus, institutions

obtain long-term financing in the primary market through the IPO process, which involves creating new securities when the company is established or when its shares are put on the public market and Her money after listing in the secondary market. (Ross et al, 2008)

IPO plays an effectual economic role, as one of the channels of investment flow across markets. According to the World Federation of Exchanges (WFE), the total value of newly created shares in 2016 was around US \$ 142.5 billion and the total value of the capital increase of listed companies was US \$ 672.3 billion. While the total value of bonds issued was approximately US \$ 4.327 trillion, 1,349 companies issued new shares during the year (World Economic Forum, 2016). However, IPO offers many benefits to the issuing company, such as increased funding for the expansion of activities and markets as well as the IPO helps in increasing the company's recognition and position in the financial community, which can reduce the cost of capital.

On the other hand, many kinds of literature tried to explain the investor's decision in capital market because of his significant place within the market through economic utility theory perspective depending on four assumptions: (1) completely rational, (2) able to deal with complex choices, (3) risk-averse and (4) wealth-maximizing, where investor prefers opportunity maximize expected return and minimize risk (Nagy&Obenberger, 1994). Likewise, subsequent studies depend on “bounded rationality” term showed that investors are prone to biases, which led to the development of behavioral finance theories (Ndirangu. et al, 2015)

Furthermore, the affected factors on investor's decisions have paid much attention to finance studies in the primary market. Bell.et al (2014) examined the role of governance mechanisms on investors' valuation of foreign IPO's in the USA, they found relationship between governance and investors' appetite for IPO's. Bruton.et al (2010) argued that concentrated ownership improves IPOs' performance in English and French companies went public.wang.et al (2017) showed that herd behavior influences IPO's demand in Taiwan market. In addition to the literature that studied differences in personal factors among investors such as Ndirangu. et al (2015) who pointed to the differences in investment decisions in the Kenyan market as a result of demographic characteristics between men, women, youth and the elderly, in addition to the social situation with regard to the preferences of the poor and rich. Furthermore, much previous research has examined the variables affected on investor 'decision in secondary market during exchange such as Kadariya (2012) investigated the impact of information on investor 'decision in Nepales stocks exchange, the findings showed that capital structure, political and media coverage, the financial education and trend analysis have impact on investor decision. Islamoğlu et al (2015) by using factor analysis methodology, determined the factors affected on investor behavior in Turkish markets.

In the same context, this paper attempts to determine the role of some proposed factors in investor's decisions during IPO's sin the Syrian market in the Medial East region. According to the literature review, four variables had determined, they classified as objective rather than personal factors by using survey methodology considering behavioral finance view.

The remainder of the paper is structured as follows. The background of the Syrian IPOs market is presented in Section 2. Section3 presents a theoretical discussing of the IPO process as well as a proposed factor with hypotheses development, section 4 presents data and methods adopted in the empirical study. Section 5 presents results and discussion of hypotheses. Section 6 presents the conclusion of the paper and future recommendations.

2. Syrian IPO's Market

The Syrian IPO market witnessed significant developments after 2000, especially with regard to the regulatory framework of the market with the establishment of the Syrian Commission for Financial Markets and Securities (SCFMS) as a regulator of the financial markets and the activities attached thereto in The number of Syrian companies that issued new shares during the period (2003-2009) is 21, knowing that the IPO was completely stopped after 2011 due to the security and political crisis. The total value of IPOs in the period under study is the US \$ 342 million, equivalent to 35% of the total capital, as well as the coverage or increase of the IPO between 100% and 988% as in Table 1:

Table (1) IPO's in Syria (2003-2009)

Company	year	amount SP	amount USD	IPO percentage of capital	Coverage ratio
Banque Bemo Saudi Fransi	2003	857,000,000	17,140,000	49%	102%
The International Bank for finance & Trade	2003	702,600,000	14,052,000	47%	111%
Bank of Syria and Overseas	2003	1,189,500,000	23,790,000	40%	208%
Bank Audi	2005	625,000,000	12,500,000	25%	988%
Arab Bank	2005	364,950,000	7,299,000	24%	441%
Byblos Bank Syria	2005	300,000,000	6,000,000	15%	198%
Syria Gulf Bank	2006	390,000,000	7,800,000	26%	245%
Cham Bank Islamic	2006	1,250,000,000	25,000,000	25%	518%
United Insurance Company	2006	433,500,000	8,670,000	51%	107%
Syrian Kuwaiti Insurance Company	2006	425,850,000	8,517,000	50.1%	167%
National Insurance Company	2006	450,500,000	9,010,000	53%	100%
SyriaInternational Insurance- Arope	2006	503,000,000	10,060,000	50%	100%
Orient Insurance Company	2006	433,500,000	8,670,000	51%	100%
Syria International Islamic Bank	2007	2,550,000,000	51,000,000	51%	336%
Al-Aqeelah Takaful Insurance	2007	1,020,000,000	20,400,000	51%	101%
SolidarityAlliance Insurance	2007	510,000,000	10,200,000	51%	144%
Bank Of Jordan- Syria	2008	505,200,000	10,104,000	34%	100%
Fransabank- Syria	2008	630,000,000	12,600,000	36%	235%

Bank Alsharq	2008	512,500,000	10,250,000	21%	438%
Qatar National Bank	2009	1,700,000,000	34,000,000	34%	268%
Al Baraka Bank	2009	1,750,000,000	35,000,000	35%	428%

3. Theoretical Discussing

3.1 IPO process

The IPO process encompasses several phases. First, when an issuer decides to issue new shares, it contracts with a lead manager or underwriter. In general, investment banks are responsible for this task, except when the task is assigned to brokerage firms in some cases. A syndicate of a leading investment bank and several other banks is usually formed to manage the issuance process (Basdeo et al, 2006)

The second step involves the legal arrangements of the regulator (the Securities Market Authority) that regulates and oversees the IPO market. The company must submit a set of documents attached to the issuance application in preparation for acceptance of the prospectus by SCA (SCFMS, 2006). The prospectus is a brochure containing a detailed information package for the issues such as the use of the proceeds of the issuance, management team information and economic feasibility with a view to protecting investors and providing all possible information necessary for their decisions (Arkebauer & Schultz, 1999).

The final stage of the IPO is when new shares become publicly available in the market and investors who wish to subscribe to the quantities they want during the announced period begin the allocation process, ending with the announcement of the success of the IPO "tombstone."

3.2 Proposed Factors and Hypotheses Development

Four factors have been suggested considering the literature review to study their effect on investor's decision during IPO's: company industry, Timing of IPO, the reputation of funders and marketing efforts during IPO.

3.2.1 The Industry of the Company

Generally, a lot of researchers studied the IPO in specific sectors such as Kalova (2017) in shipping sector, Satta et al (2017) in port industry, Alqahtani&Boulanouar (2017) in sharia compliance status, Anderloni & Tanda(2017) in green energy companies, Initially, it is expected that investor preferences and therefore decisions will vary depending on the sector of the company issuing securities by IPO,IPO's are distributed between banks and insurance during the period under study in Syria Therefore, in this research so it is hypothesized that:

Hypothesis 1: company industry effect on investor's decision in the Syrian IPO's market.

3.2.2 Timing of IPO

Timing of going public is the most critical element in the IPO process, it is related directly to the success of IPO, and one-third of companies are convinced that timing of IPO is the most important point when considering an IPO (Deloitte, 2016). according to Ljungqvist (2006) during certain periods, individual investors are very optimistic and overvalued the company shares, that motivate owners to take the decision of IPO,Similarly, the increase in demand more than supply during selling a new shears leads to "hot IPO" phenomenon as a result to some investment opportunities available to companies in particular period.(Benninga et al,2005), In short, the timing of IPO associated with investors' mode in one hand and company position in the other. Therefore, the second hypothesis in this paper as following:

Hypothesis 2: timing of IPO effect on investor's decision in the Syrian IPO market.

3.2.3 The Reputation of the Involved Parties

There is no specific and clear definition of company's reputation concept, where the definition was addressed according to different views of the researchers based on their scientific backgrounds, supposedly, the oldest definition of reputation has been contained in Webster's Dictionary in 1913 as "the assessment of public opinion to someone; the character to attribute to a person, thing or action; repute" (Manto & Alan, 2001)

In IPO's Market, reputation plays an important role for several Parties, first the reputation of issue manager (underwriter) has impact on demand for new shares and their price in secondary market letter, in the same time the underwriter has a direct interest in the success of IPO and getting good prices because the reverse may expose it to reputation risk, In contrast, the investment bank also prefers to deal with reputable companies regarding management and marketing of its issuances, which increases the chances of the bank to gain new issuers in the future, which is the same on the companies side as the contract with a reputable investment bank directly affects the outcome of the IPO. (Nanda,1997),(Guner et al,2000), (Ertuna et al, 2003), (Kenourgios et al, 2007) and(Yip et al,2009),

With respect to founders and block holder's reputation, some studies concluded that reputation of venture capitalist firms contributes directly to success of IPO and its performance after issuing (Krishnan et. al, 2011), As well for large owners who enhance the performance of shares in the market after listing because of their reputation especially, when they keep their investments in the corporation. (Cronqvist & Fahlenbrach, 2009) Consequently, the third hypothesis in this paper as following:

Hypothesis 3: owner's reputation effect on investor's decision in the Syrian IPO market.

3.2.4 Marketing Efforts During IPO

According to Luo (2008), most of the IPO research has been studied in the financial literature, while it has not received sufficient attention from a marketing perspective. Therefore, the "marketing and finance interface" is an effective approach to creating value for shareholders, and has concluded that there is a relationship between marketing spending received from the IPO depending on customer equity theory of market-based assets,

Bahadir et al (2015) focused on signal theory as a theoretical framework for the relationship between the company's ability to attract potential investors to its issues and its marketing efforts before issuance, where marketing efforts provide a clear signal to investors about the quality of the company and its future.

On the other hand, Demers and Willen (2002) found that media attention leads to an increase in the IPO price in the stock market as well as improved product market performance for Internet companies in the USA. In addition, Cook et al (2006) proved the important role of advertising in attracting new investors and achieving issuance goals. Based on the above, this research is hypothesized that:

Hypothesis4: marketing efforts during IPO effect on investor's decision in the Syrian IPO market.

4. Data and Methods

In order to achieve the objectives of the research in defining the impact of the company's industry, the timing of the IPO, the reputation of the owners and the marketing efforts on the investors' response for the IPO, the preliminary data was approved through the questionnaire form for individual investors in the Damascus Securities Exchange. A total of 270 analyzable forms were retrieved (N=270)

The questionnaire involves two parts, the first part about for personal information of the respondents, and the second for questions of four proposed factors divided into 20 questions depending on the Fifth Likert Scale. Also, the validity and reliability of the questionnaire were tested using Alpha Cronbach test, where the results refer to the validity of every question and the questionnaire as a whole (> 0.8).

Statistical Package for Social Science (SPSS) Version 20 software by IBM is used to data analysis and to infer the relationship between the variables. We used some descriptive statistics and a one-sample t-test to testing research hypotheses by definition which factor has the most and least impact on investors' decisions in the Syrian IPOs market.

5. Results and Discussion

In this part, the analysis of collected data was conducted regarding the characteristics of the sample and descriptive statistics of variables in addition to hypotheses testing.

5.1 Sample Criteria Analysis

The characteristics of the studied sample are shown in table 3-1 as follows:

Most respondents (61%) were male versus 39 percent are female. Based on age, about 75% of respondents are in the age group of 25- 35 followed by 12 percent in the 35-45 age group, while 10 percent are above 45 years. This indicates the nature of Syrian society where the majority of the population is young, which extends to investors of the financial market belonging to the same category.

In terms of educational background, 50 percent of respondents have a bachelor's degree and 37 percent have a master's degree. Regarding investment experience. Majority of the respondents (56%) have 6-10 years of investment experience, while 28% have 1-5 years of experience. It is a result of the fact that the stock market in Syria is a new one that was opened in 2009 and thus the experience of investors in this sector.

Regarding occupation, 59 percent of the respondent belongs to freelancers group, while 31 percent are from employees' group. On the other hand more than half of sample (51%) had a bachelor's degree, 37 percent had master degree.

Table 3.1 Criteria of Respondents' Sample

Gender	Male	Female			N
Percentage	61%	39%			270
Age	Less than 25	25-35	35-45	More than 45	
Percentage	3%	75%	12%	10%	
occupation	employee	freelancers	student	retirees	
Percentage	31%	59%	6%	4%	
Education	High school	bachelor's	Master	PhD	
Percentage	13%	50%	32%	5%	
Experience	1-5 years	6-10 years	11-15 years	More than 15 years	
Percentage	29%	59%	10%	2%	

Source: SPSS results

5.2 Descriptive Statistics

Table 3.2 contains the standard deviation and mean of the study variables to determine the significance of these variables statistically

Table 3.2 Descriptive Statistics

Variable	N	mean	standard deviation	important
Industry of company	270	3.7111	.91485	High
Timing of IPO	270	4.2222	.46875	High
Reputation of owners	270	4.1000	.70392	High
Marketing efforts	270	3.5333	1.01727	High

Source: SPSS results

All variables have high important means (≥ 3.5), also the values of the means lay between 3.2 and 4.2 which refers to converging in terms of importance and indicates the similarities of the views of the sample on the variables influence. At the same time, standard deviation values indicate that respondents' answers are not dispersed.

5.3 Hypotheses Test

A single sample t-test was used to verify the research hypotheses in determining the impact of the four proposed factors on the investor's decision during the IPO,

Depending on the comparison of the calculated average with the adjusted average (3.4). An alternative hypothesis is accepted if the Sig level is smaller than the 5% value.

Table 3.3 the one-sample t-test results

Variable	t	df	Sig. (2-tailed)	Hypothesis test
Industry of company	57.625	16	.421	rejection
Timing of IPO	2.582	16	.020	Acceptance
Reputation of owners	2.606	16	.000	Acceptance
Marketing efforts	4.123	16	.010	Acceptance

Source: SPSS results

The table shows that the significance level for all factors at $p < 0.05$ except “industry of company” factor, that means the sample agree with three hypotheses of research, and their investment decisions during IPO affected by timing of IPO, reputation of owners and marketing efforts, as well, investors negligence of to the company industry may be due to the weak of investment culture and the inability to distinguish the risks and benefits associated with each industry.

Investors do not attach importance to the sector of the company because of the structure of the IPO market, where financial companies dominated the size and number of issues during the period under study. Moreover, timing plays an important role in investor decision as a result of the published news and information impact in general, especially the news of the imminent opening of the Damascus Securities Exchange as a new channel for investment and to evaluate investments in the IPO, especially after taking into account the phenomenon of underpricing. Likewise, trust comes from reputations, especially when investing in companies that offer their shares for the first time to the public. It is also a reflection of society and culture that relies heavily on personal relationships, which spill over into business. At the same time, marketing efforts can change the outcome of the issuance with its overlaps to influence consumer/investor decisions, meaning that marketing before and in conjunction with the issuance helps the company achieve its goals by contributing to persuading potential investors.

6. Conclusion

The results of this paper show that three factors (Timing, reputation, and marketing) have a significant impact on an investor's demand at a new share issued by the IPO process. In other words, Syrian investors are paying more attention to these three variable, while not caring for the industry of firm issued new shares.

We hope that Syrian investors can enhance their knowledge and skills to make a fit investment decision decisions. Likiwiss, Syrian companies can also use this scintafic approach to increase the efficiency of the IPO decision, as well as capital market regulators that can empower IPO process monitoring.

General, this study recommends that the Syrian policymakers should put a sold plan to encourage companies to go public, which may lead to economic advantages and diversification of investment channels, thus contributing to development goals atchevment.

For future research, more research for more factors that may influence investor decision in the financial market whether rational or behavioral, as well as a comparative study on the decisions of investors in different markets.
